

INIXA PROMPT BATTLE ARENA

Official College Symposium Tournament Rulebook & Game Guide

1. Event Overview & Core Concept

The **INIXA Prompt Engineering Battle** is a real-time technical competition designed for college symposiums. Participants compete under time pressure to craft instructions (prompts) that force Large Language Models (LLMs) to solve complex **Text Research** and **Coding Challenges** with extreme precision.

2. Available Competition Games & Challenges (6 Games)

Category	Game Title & Difficulty	Target Objective & Constraints
Text Research	1. Unstructured Data to Typed JSON [Medium 4 mins]	Extract key support transcript metadata into valid JSON. <i>Constraints: Strict JSON schema, no markdown fences, no conversational filler.</i>
Text Research	2. Zero-Hallucination Extraction [Hard 5 mins]	Format medical study quantitative findings into Markdown tables. <i>Constraints: Zero hallucination, strictly < 50 output tokens.</i>
Text Research	3. Constrained Roleplay & Reasoning [Extreme 3 mins]	Explain Quantum Entanglement to high schoolers. <i>Constraints: Do NOT use the letter 'e' anywhere in explanation (< 60 words).</i>
Coding Battle	4. Algorithmic Optimization $O(N^2) \rightarrow O(N)$ [Medium 5 mins]	Refactor slow nested loop duplicate finder into $O(N)$ HashMap. <i>Constraints: Strict $O(N)$ complexity, JSDoc comments included.</i>
Coding Battle	5. Reverse Code Engineering [Hard 5 mins]	Generate clean tail-recursive deep array flattener from trace. <i>Constraints: No <code>Array.prototype.flat()</code>, handle arbitrary depth.</i>
Coding Battle	6. Zod Schema Transpiler [Extreme 6 mins]	Transpile OpenAPI paths into complete Zod validation schemas. <i>Constraints: Export Zod schema + inferred TS type definitions.</i>

3. Step-by-Step Playing Instructions

- **Step 1: Select Game Category:** Choose between Text Research & Reasoning or Coding Battle.
- **Step 2: Pick AI Model:** Select from GPT-5.6 (UPDF), DeepSeek V4 Pro, Qwen 3.7 Max, Perplexity Copilot, or GPT-5.4 Mini.
- **Step 3: Analyze Constraints:** Review sample input context & mandatory rules (JSON only, $O(N)$ complexity, zero letter 'e').
- **Step 4: Execute Prompt:** Construct prompt in editor & click 'Execute Prompt'. Watch live real-time token stream output.
- **Step 5: Automated AI Judge Score:** Click 'AI Judge Score' to receive an instant 0-100 score breakdown across Accuracy, Constraints, and Token Efficiency.

4. Auditorium Stage 1v1 & Official Scoring Rubric

Evaluation Metric	Weightage	Criteria Description
Target Output Accuracy	40%	Output precision matching JSON schema, table structure, or refactored algorithm.

Constraint Adherence	30%	100% compliance with negative constraints (no letter 'e', no markdown fences, O(N)).
Token & Speed Efficiency	20%	Concise prompt construction with minimal token waste and fast completion time.
Technique & Elegance	10%	Use of delimiters, role assignment, and few-shot/CoT prompt engineering techniques.
